## Surds

### How do surds behave?

$$\sqrt{4} + \sqrt{9} = 2 + 3 = 5$$
 $\sqrt{4+9} = \sqrt{13} \neq 5$ 

Compare:

A quick calculator check gives:

$$\sqrt{2+3}$$
 and  $\sqrt{2}+\sqrt{3}$ 

$$\sqrt{2+3} = \sqrt{5} = 2 \cdot 23...$$

Not the same

$$\sqrt{2} + \sqrt{3} = 1.41... + 1.73... = 3.14...$$

$$\sqrt{2\times3} = \sqrt{6} = 2\cdot44\dots$$

They might be the

$$\sqrt{2\times3}$$
 and  $\sqrt{2}\times\sqrt{3}$ 

$$\sqrt{2} \times \sqrt{3} = 1 \cdot 41... \times 1 \cdot 73... = 2 \cdot 44...$$

$$\times \sqrt{3} = 1.41...\times 1.73... = 2.44...$$

$$\sqrt{\frac{2}{3}}$$
 and  $\frac{\sqrt{2}}{\sqrt{3}}$ 

$$\sqrt{\frac{2}{3}} = 0.81...$$

$$\frac{\sqrt{2}}{\sqrt{3}} = \frac{1.41...}{1.73...} = 0.81...$$

They might be the same!

The general rules that are true are:

$$\sqrt{a \times b} = \sqrt{a} \times \sqrt{b}$$
 and  $\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$  These can be proved.

Note: 
$$\sqrt{a}^2 = \sqrt{a} \times \sqrt{a} = \sqrt{a \times a} = \sqrt{a^2} = a$$

When simplifying a surd look for the highest square number factor.

# Simplifying surds

To simplify  $\sqrt{108}$  find a factor of 108 that is

So 
$$\sqrt{108} = \sqrt{9 \times 12} = \sqrt{9} \times \sqrt{12} = 3 \times \sqrt{12}$$
.

a square number, e.g. 9. You know  $108 = 9 \times 12$ .

Just as  $3 \times x$  is written 3x so  $3 \times \sqrt{12}$  is written  $3\sqrt{12}$ . Now 12 has a square factor of 4.

So 
$$3\sqrt{12} = 3 \times \sqrt{4 \times 3} = 3 \times \sqrt{4} \times \sqrt{3}$$

$$=3\times2\times\sqrt{3}=6\times\sqrt{3}=6\sqrt{3}$$

Here is a quicker method:

$$\sqrt{108} = \sqrt{36 \times 3} = \sqrt{36} \times \sqrt{3} = 6 \times \sqrt{3} = 6\sqrt{3}$$

When the number under the root sign is as small as possible (no more square factors other than 1) you have fully simplified the surd.

(b)

# Rationalising the denominator

The denominator is irrational (a surd)

$$\frac{2}{\sqrt{5}} = \frac{2 \times \sqrt{5}}{\sqrt{5} \times \sqrt{5}} = \frac{2\sqrt{5}}{5}$$
The denomination (an integer)

The denominator is now rational

#### **Process**

You use  $\sqrt{a} \times \sqrt{a} = a$  to get rid of the root sign in the denominator.

# **Example**

Express  $\frac{2}{\sqrt{18}}$  as a fraction with a rational denominator.

**Solution** 

$$\frac{2}{\sqrt{18}} = \frac{2}{\sqrt{9 \times 2}} = \frac{2}{3\sqrt{2}} = \frac{2 \times \sqrt{2}}{3\sqrt{2} \times \sqrt{2}} = \frac{2\sqrt{2}}{3 \times 2} = \frac{\sqrt{2}}{3}$$

Simplify  $\sqrt{18}$ 

multiply top and bottom by  $\sqrt{2}$  to rationalise the denominator

divide top and bottom by 2 (cancel by 2)

# **Further simplification**

If you think of  $\sqrt{2}$  as an unknown number like x then you can compare

$$2\sqrt{2} + 3\sqrt{2} = 5\sqrt{2}$$

with

$$2x + 3x = 5x$$

Similarly, by comparing with x+3y+4x-y you can simplify

$$\sqrt{3} + 3\sqrt{2} + 4\sqrt{3} - \sqrt{2}$$

$$= \sqrt{3} + 4\sqrt{3} + 3\sqrt{2} - \sqrt{2}$$

$$= 5\sqrt{3} + 2\sqrt{2}$$

# top tip

(compare x + y)

# **Examples**

Simplify:

(a) 
$$2\sqrt{5} - 3\sqrt{2} + \sqrt{5} + 4\sqrt{2}$$
 (b)  $\sqrt{2} + \frac{2}{\sqrt{2}}$ 

(b) 
$$\sqrt{2} + \frac{2}{\sqrt{2}}$$

#### **Solutions**

(a) Rewrite as

$$2\sqrt{5} + \sqrt{5} + 4\sqrt{2} - 3\sqrt{2} = 3\sqrt{5} + \sqrt{2}$$

(compare 2x-3y+x+4y)

(b) 
$$\sqrt{2} + \frac{2}{\sqrt{2}} = \sqrt{2} + \frac{2 \times \sqrt{2}}{\sqrt{2} \times \sqrt{2}} = \sqrt{2} + \frac{2\sqrt{2}}{2} = \sqrt{2} + \sqrt{2} = 2\sqrt{2}$$

Rule	Comments	Examples
$x^m \times x^n = x^{m+n}$	When multiplying, the indices are added. Note: not in the case $x^m \times y^n$ !	$a^2 \times a^3 = a^{2+3} = a^5$
$\frac{x^m}{x^n} = x^{m-n}$	When dividing, the indices are subtracted.	$\frac{c^7}{c^3} = c^{7-3} = c^4$
$(x^m)^n = x^{mn}$	When raising a power to a power, multiply the indices.	$(y^3)^4 = y^{3\times 4} = y^{12}$
$x^{0} = 1$	Any number or expression (other than zero) raised to the power zero gives 1.	$2^{0} = 1$ $\left(\frac{1}{2}\right)^{0} = 1$ $(a+b)^{0} = 1$
$x^{-n} = \frac{1}{x^n}$	Something to a negative power can be rewritten as 1 divided by the same thing to the positive power.	$a^{-1} = \frac{1}{a^1} = \frac{1}{a}  a^{-3} = \frac{1}{a^3}$
